

# **WEB PROGRAMMING**

## **1.What is web programming?**

-> Web programming refers to the writing, markup and coding involved in Web development, which includes Web content, Web client and server scripting and network security. The most common languages used for Web programming are XML, HTML, JavaScript, Perl 5 and PHP. Web programming is different from just programming, which requires interdisciplinary knowledge on the application area, client and server scripting, and database technology.

-> To improve user experience and related functionalities on the client side, JavaScript is usually used. It is an excellent client-side platform for designing and implementing Web applications.

-> HTML5 and CSS3 supports most of the client-side functionality provided by other application frameworks.

## **2.what is full form of HTML ? and what is its version?**

-> HYPER TEXT MARKUP LANGUAGE .

-> current version is HTML5

### 3.How do we write code in HTML?

```
<!DOCTYPE html>
```

```
<html>
```

```
<body>
```

```
<h1>My First Heading</h1>
```

```
<p>My first paragraph.</p>
```

```
</body>
```

```
</html>
```

### 4.Difference b/w LAN,MAN & VAN

-> A LAN (local area network) is a group of computers and network devices connected together, usually within the same building.

-> A MAN (metropolitan area network) is a larger network that usually spans several buildings in the same city or town.

-> A WAN (wide area network), in comparison to a MAN, is not restricted to a geographical location, although it might be confined within the bounds of a state

or country. A WAN connects several LANs, and may be limited to an enterprise (a corporation or an organization) or accessible to the public. The technology is high speed and relatively expensive. The Internet is an example of a worldwide public WAN.

## **5. Difference between physical address and logical address**

-> The logical address is a virtual address and can be viewed by the user. ... The fundamental difference between logical and physical address is that logical address is generated by CPU during a program execution whereas, the physical address refers to a location in the memory unit.

## **6.What are h1-h6 tags in HTML?**

```
<!DOCTYPE html>
```

```
<html>
```

```
<body>
```

```
    <h1>Heading 1</h1>
```

```
    <h2>Heading 2</h2>
```

```
    <h3>Heading 3</h3>
```

```
    <h4>Heading 4</h4>
```

```
    <h5>Heading 5</h5>
```

```
    <h6>Heading 6</h6>
```

```
</body>
```

```
</html>
```

Eg:

# Heading 1

## Heading 2

### Heading 3

#### Heading 4

##### Heading 5

###### Heading 6

## 7. How many types of tags are there in HTML and what are they ?

### 1. Paired and Unpaired Tags

**Paired Tags :** `<p>` This text is a paragraph . `</p>`

**Unpaired Tags :**

`<p>` This is a paragraph `</p>`

`<hr>`

`<i>` `<b>` This is a bold and italicized text `</b>` `</i>`

### 2. Self-Closing Tags

``

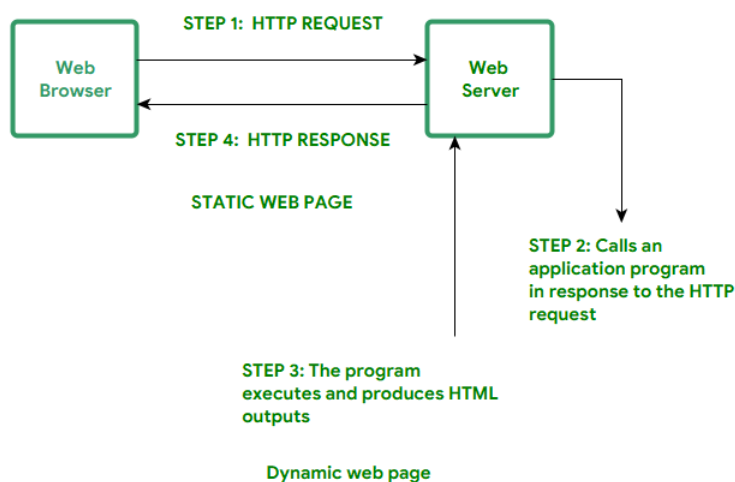

### 3. Utility-Based Tags

-> This is done using tags like <font>, <b>, <u>, etc. Tables, divisions, and span tags are also those tags that help format a web page or document and set the layout of the page.

### Control Tags

Another category of tags that can be created is 'Control Tags'. The Script tags, radio buttons or checkboxes, the Form tags, etc., forms the control tags

### 8. what is a web page and what are the different types of web pages?

web page is a document available on world wide web. Web Pages are stored on web server and can be viewed using a web browser. A web page can cotain huge information including text, graphics, audio, video and hyper links. These hyper links are the link to other web pages

### **-> Static Web pages:**

Static Web pages are very simple. It is written in languages such as HTML, JavaScript, CSS, etc. For static web pages when a server receives a request for a web page, then the server sends the response to the client without doing any additional process. And these web pages are seen through a web browser. In static web pages, Pages will remain the same until someone changes it manually.

### **-> Dynamic Web Pages:**

Dynamic Web Pages are written in languages such as CGI, AJAX, ASP, ASP.NET, etc. In dynamic web pages, the Content of pages is different for different visitors. It takes more time to load than the static web page. Dynamic web pages are used where the information is changed frequently, for example, stock prices, weather information, etc.

## **9.what is a website ?**

A website is a collection of web pages and related content that is identified by a common domain name and published on at least one web server. Notable examples are wikipedia.org, google.com, and amazon.com. All publicly accessible websites collectively constitute the World Wide Web

## WEEK – 2

### **1. what is the difference between head title and body in html**

## **HTML Head**

Head is the first part of the HTML document that is used to add additional information to the HTML document.

Head contains meta information, the title of the page, internal style, external stylesheet link, internal javascript, external JavaScript file linking, etc.

The head is not required to be present in the document, but it is recommended to be present.

There should only be one head in an HTML document.

The Head is a block of information that is placed at the top of the document.

The head is the first section of the document and contains information that is shared by all the pages in the document.

## **HTML Body**

Body is the part of HTML that contains the content of the page. The body section is the second section of the HTML document where the first section is head.

Everything that you see, read or hear on a browser lies in the body of HTML, like text, images, GIFs, videos, audios, etc.

## **2.what is the difference between mobile application and web application**

### **Native Apps:**

Native apps are installed onto the device itself and are developed especially for a particular mobile operating system. These apps are available on app stores such as Apple App Store, Google Play Store, etc.

Native apps work in specific mobile operating systems such as Apple iOS or Android OS. If an app made for Android OS then it will not work on Apple iOS or Windows OS. We have to build separate apps for each operating system if we want to work our app across all major operating systems. This means we have to spend more money and more effort (time, resources).

### **Web Apps:**

Web Apps can be accessed through the mobile device's Web browser, Web Apps are based on internet-enabled applications. In order to access we don't need to download and install the app onto a mobile device.

The app is developed as web pages in HTML and CSS, interactive parts are developed in JQuery, JavaScript, or similar language. The single web app can be used on most devices capable of surfing the web, it does not depend upon the operating system they use.

## **3. various cateograies of tags in html**

The HTML tags can also be simply divided based on basic categories like **Basic HTML Root Tags, Formatting tags, Audio and Video Tags, Form and Input Tags, Frame Tags, Link Tags, List Tags, Table Tags, Style Tags, Meta Tags**, etc.

### **1. Paired and Unpaired Tags**

**Paired Tags :** <p> This text is a paragraph . </p>

### **Unpaired Tags :**

`<p> This is a paragraph </p>`

`<hr>`

`<i> <b> This is a bold and italicized text </b> </i>`

### **2. Self-Closing Tags**

``

### **3. Utility-Based Tags**

-> This is done using tags like `<font>`, `<b>`, `<u>`, etc. Tables, divisions, and span tags are also those tags that help format a web page or document and set the layout of the page.

### **Control Tags**

Another category of tags that can be created is 'Control Tags'. The Script tags, radio buttons or checkboxes, the Form tags, etc., forms the control tags
